

Category Move / Merge – Client Testing Guide

Oct 7, 2026 · @Khushboo

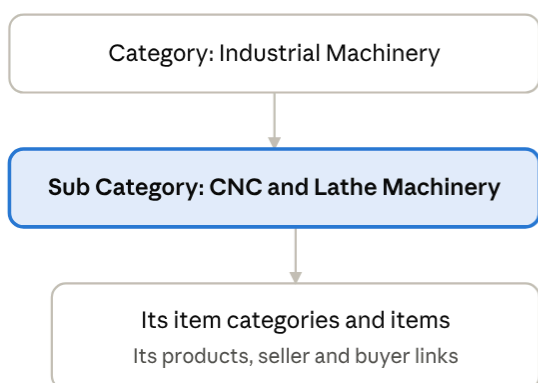

About this feature

The new **Move / Merge** page lets an admin restructure the Category Master in one step, and every linked record across the system updates automatically. It is in the admin panel under **Category Master → Move / Merge**.

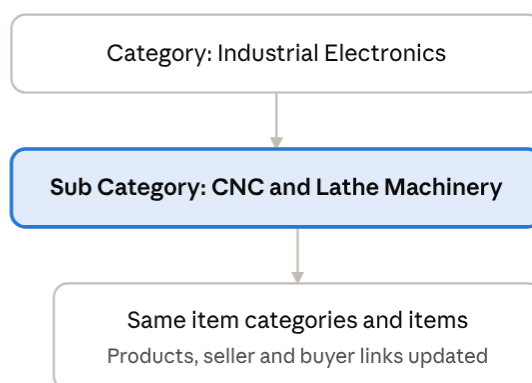

Action	What it does	Example
Move	Shifts a record, with everything under it, to a different parent. The record stays at the same level.	Move Sub Category “Mobile” from Electronics to Telecom
Merge / Replace	Replaces one record with another existing record of the same level. Everything linked moves to the target, then the old record goes to Recently Deleted.	Replace “Mobile” with the existing “Smartphone”

A Move takes the record and everything under it to the new parent

BEFORE

AFTER

Move example · Test 2 below

The record keeps its name and level; only its parent changes, and everything under it follows.

What can be moved, and where to:

Level	Can move under	Merge
Category	Not movable (top level)	Yes
Sub Category	Any Category	Yes
Item Category	Any Sub Category	Yes
Item Sub Category	Any Item Category	Yes
Item	Any Item Sub Category	Yes

Records updated automatically on every Move or Merge: sub categories, item categories, item sub categories, items, products, seller category mappings, buyer sourcing interests and product keywords. All changes run together: if any step fails, nothing is changed.

To only rename a record, use **Edit** on its list page instead. Names are linked by ID, so a rename already shows everywhere. Past enquiries keep the category name they were created with, by design.

Before you start

Test on the **staging / test server only**, never on the live website: Move and Merge change real data immediately.

- ☐ You have the test admin panel URL and an admin login.
- ☐ Ask the development team to take a **database backup** before testing. A Merge cannot be undone from the screen, so the backup is how test data is restored afterwards.
- ☐ Keep a second browser tab open on the test **website** (front end). Most checks open website pages to confirm the change.
- ☐ Note the time you start. You can filter the History table by date later.

How the page works, in four steps:

1. **What do you want to do?** Pick Move or Merge / Replace.
2. **Choose the level.** Sub Category, Item Category and so on.
3. **Select the record and where it should go.** Type a name, part of the path or an ID to search.
4. **Review the impact and apply.** A preview shows the path before and after, how many records will change, and the products affected. Nothing changes until you confirm in the pop-up.

The example names below (for example “CNC and Lathe Machinery”) exist in the current data. If one is missing on your server, pick any similar record with a few products.

Test 1 – Search and page basics

Goal: the page loads, and records can be found by name, path or ID.

#	Do this	Expected result
1.1	Open Category Master → Move / Merge	Page opens with steps 1–4 and a History table below
1.2	Click the Merge / Replace card, then Move again	The selected card is highlighted with a tick
1.3	In Step 2, check the level buttons while Move is selected	Category is not shown (it cannot be moved)
1.4	Select Sub Category , type <code>automation</code> in the left box	Matching sub categories appear, each with its product count, child count and current parent path
1.5	Type a sub category ID, e.g. <code>62</code>	“Semiconductor Device” appears at the top
1.6	Type <code>xyz123</code>	Message: “No Sub Category found for ‘xyz123’”
1.7	Select Item Category , type two words, e.g. <code>component discrete</code>	“Discrete Semiconductors” appears (both words match its path)
1.8	Leave the left box empty and look at the right box	It is disabled with “Select a ... first”

Test 2 – Move a Sub Category

Goal: Sub Category **CNC and Lathe Machinery** moves from **Industrial Machinery** to **Industrial Electronics**, with its item categories and products, and shows in the new place on the website. Then it is moved back.

Before: open the website category page for **Industrial Machinery** and confirm “CNC and Lathe Machinery” is listed there.

#	Do this	Expected result
2.1	Step 1: Move . Step 2: Sub Category	Two search boxes appear

#	Do this	Expected result
2.2	Left box: search cnc , select CNC and Lathe Machinery	Under the boxes: “currently in Industrial Machinery”, with its product and item category counts
2.3	Right box: search industrial elec , select Industrial Electronics	Step 4 preview appears on its own
2.4	Read the preview	NOW: Industrial Machinery > CNC and Lathe Machinery. AFTER: Industrial Electronics > CNC and Lathe Machinery. Count tiles show sub categories, item categories, products, seller mappings
2.5	Click Current parent page and New parent page links	Each opens in a new tab. CNC is listed on the current parent, not on the new one
2.6	In “Products that will move”, open one product’s Website and Admin links	Product page and admin edit page open. Status badge shows Live, Not approved or Inactive
2.7	Click Move ... records , then Cancel in the pop-up	Nothing changes, no new History row
2.8	Click Move ... records again, then Yes, move now	Success message, green “Done” box, new History row
2.9	In the green box, open Old Category: Industrial Machinery	CNC is no longer listed
2.10	Open New Category: Industrial Electronics	CNC is listed, with its products
2.11	Open one moved product from the green box	Its category shows Industrial Electronics
2.12	Admin → Sub Categories list, search CNC	Category column shows Industrial Electronics
2.13	Admin → Item Categories , open one item category under CNC	Category shows Industrial Electronics, Sub Category still CNC
2.14	Seller profile of a seller who sells under CNC	Their category list shows Industrial Electronics → CNC and Lathe Machinery
2.15	Move it back: repeat 2.1–2.8 with Industrial Machinery as the new parent	Everything returns to how it was in the Before check

Test 3 – Move an Item Category

Goal: Item Category **Industrial Robots** moves from Sub Category **Automation & Robotics Equipment** to **Industrial Cooling Equipment**. Its item sub categories, items and products follow, and sellers of those products get the new category on their profile.

#	Do this	Expected result
3.1	Step 1: Move . Step 2: Item Category	Right box asks for a Sub Category
3.2	Left: search industrial robots . Right: search cooling equipment , select Industrial Cooling Equipment	Preview appears
3.3	Check the preview	AFTER path ends in Industrial Cooling Equipment > Industrial Robots. Products listed (e.g. 6 DOF ROBOT, Janome Industrial robots)
3.4	Look for the seller option under the products	“Also add the new category / sub category to the profile of sellers whose products move (N sellers)”, ticked by default
3.5	Leave it ticked, click Move ... records → Yes, move now	Success; History row shows Seller mappings added: N
3.6	Open New Sub Category link from the green box	Industrial Robots is listed under Industrial Cooling Equipment
3.7	Open product 6 DOF ROBOT on the website	Its sub category shows Industrial Cooling Equipment
3.8	Open the seller profile of that product's company	Industrial Cooling Equipment is now in their category list
3.9	Move it back to Automation & Robotics Equipment	Industrial Robots is back under its original sub category. The seller mapping added in 3.5 stays on the seller profile; moving back does not remove it

Test 4 – Merge / Replace

Goal: Item Sub Category **Transistors** is replaced by **Depaneling Machine**. All of Transistors’ products, items and buyer interests move to Depaneling Machine, and Transistors goes to Recently Deleted.

A Merge cannot be undone from the screen. Restore the database backup after this test.

#	Do this	Expected result
4.1	Step 1: Merge / Replace . Step 2: Item Sub Category	Category is also available as a level here
4.2	Left: search transistors . Right: search depaneling , select Depaneling Machine	Preview appears; Transistors is not offered in the right box
4.3	Click Swap between the boxes, then Swap again	The two selections change places, then return
4.4	Read the preview	Lists “will be soft deleted” and “main keyword ... will be removed”; Products count matches the Products tile
4.5	Click Merge ... records → read the pop-up	Shows Now / After paths, record count and that Transistors moves to Recently Deleted
4.6	Click Yes, merge now	Success message and History row with a Merge tag
4.7	Open the target link from the green box	Depaneling Machine now shows Transistors’ products too
4.8	Open one former Transistors product	Its item sub category is Depaneling Machine
4.9	Admin → Item Sub Categories → Recently Deleted	“Transistors-deleted-...” is listed
4.10	Search transistors again in the Move / Merge left box	Not found (it is deleted)

Test 5 – Error and safety checks

Goal: wrong or risky actions are blocked or need confirmation.

#	Do this	Expected result
5.1	Move a Sub Category to the Category it is already in	Red message: “... is already under ...”; no Apply button
5.2	Merge: select a record on the left, then check the right box	The same record is not offered as a target

#	Do this	Expected result
5.3	Choose both boxes, then change the level in Step 2	Selections and preview are cleared
5.4	After a preview appears, click Start over	All selections and the preview are cleared; no data changes
5.5	Open the confirm pop-up and close it with the ×	Nothing changes
5.6	Move a record that has no products	Preview shows no products list and no Products tile; Move still works
5.7	After any Move, refresh the page	The record shows at its new place in the search results (new parent path)

Test 6 – History table

Goal: every Move and Merge is recorded, its paths link to the website, and the filters find it.

#	Do this	Expected result
6.1	Look at the History rows from Tests 2–4	Each shows Action (Move / Merge tag), Level, From, To, records updated, Done by (admin name), date and time
6.2	Click a blue name in From or To	That category's website page opens in a new tab, at its current place
6.3	Look at the Merge row from Test 4	"Transistors" is struck through and has no link (it was deleted)
6.4	Click View → Website on any row	The record's current website page opens
6.5	Date: Today, then Last month	Today shows the test rows; Last month shows none
6.6	Date: Custom range, pick today in From and To	From / To date boxes appear; today's rows show
6.7	Action: Merge / Replace	Only Merge rows
6.8	Level: Item Category	Only Item Category rows
6.9	Category: Industrial Machinery	Only rows that came from or went to Industrial Machinery

#	Do this	Expected result
6.10	Done by: your admin name	Only your rows
6.11	Search: type robot	Rows whose paths contain “robot”
6.12	Set two or three filters together	“Clear filters (n)” appears at the top right
6.13	Click Clear filters	All filters reset and all rows show
6.14	Click the Done by and Date column headers	Rows sort by that column

Result sheet

Fill one row per test. Mark **Fail** if any step in that test did not match its expected result, and note the step number.

Test	Result	Failed step(s)	Notes	Tested by / date
1 – Search and page basics	Not tested			
2 – Move a Sub Category	Not tested			
3 – Move an Item Category	Not tested			
4 – Merge / Replace	Not tested			
5 – Error and safety checks	Not tested			
6 – History table	Not tested			

To report an issue, send:

1. The step number (for example 2.9).
2. What you expected and what you saw.
3. A screenshot of the page, and of the website page if a link was involved.
4. The time it happened, so it can be matched to the History table.

After testing, ask the development team to restore the database backup so the test changes are removed.
